1994 ALABAMA COTTON VARIETY REPORT

A REPORT OF THE PERFORMANCE OF COTTON VARIETIES TESTED IN ALABAMA

K. M. Glass and D. I. Bransby¹

INTRODUCTION

The Alabama Cotton Variety Test is a continuing evaluation of available cotton varieties from private companies and state agricultural experiment stations. Breeding lines that are likely to be released as varieties are also tested. Tests are conducted on units of the Alabama Agricultural Experiment Station by Experiment Station personnel. Cultural practices are those generally recommended by Auburn University to producers. Data is reported on an irrigated test at both Belle Mina and Shorter. No other tests received scheduled supplemental irrigation. Every effort is made to test the varieties and present the results in an unbiased manner.

EXPERIMENTAL CONDITIONS

A randomized complete block experimental design with four replications was used at each location. Row length varied at different locations from 20 to 120 feet. Plot width was two rows at Prattville, Headland, Belle Mina, Shorter, Talladega, Fairhope, and Crossville, and one row at Brewton and Monroeville. Rainfall was generally adequate at all locations during the spring. The harvest season was warm and favorable for maturing and harvesting the crop.

¹Research Assistant and Professor of Agronomy and Soils.

EXPLANATION OF DATA

HARVEST OF SEED COTTON

Tests at Belle Mina, Headland, and Shorter were harvested by a mechanical spindle picker. The tests at Prattville, Monroeville, and Fairhope were harvested by hand. Average yield of seed cotton was determined for each variety at each location.

LINT PERCENTAGE

Seed cotton samples from each variety were ginned on a 10-saw gin. Lint percentage was calculated by dividing weight of lint by weight of seed cotton.

YIELD OF LINT

Lint yield was determined by multiplying the lint percentage by yield of seed cotton.

FIBER PROPERTIES

Fiber qualities of all varieties were determined by the Auburn University Textile Engineering fiber testing laboratory using High Volume Instrumentation (HVI). Data are reported on a single composite sample of each variety from all locations including the regional tests at Shorter and Belle Mina.

Length. This is the fiber length measured with the HVI instrument. This measurement of length is approximately the same as the classer's staple.

Strength. A measure of breaking strength of a standard fiber bundle with the holding jaws separated by 1/8 inch. Tex is a size measurement of the fiber bundle and the data given are the force in grams needed to break this bundle.

Elongation. A measure of the percentage stretch before the fibers break.

Micronaire. This measures the fineness of the cotton fibers. The smaller the micronaire reading, the finer and/or more immature the fibers. The desirable range of micronaire is 3.5 to 4.9.

EARLINESS

Where more than one harvest was made, earliness is reported as the percentage of the total yield harvested at the first picking.

FUSARIUM WILT

Reaction of varieties to Fusarium oxysporum f. vasinfectum (fusarium wilt) was evaluated at the Plant Breeding Unit, Tallassee. The varieties were grown in a field with a high natural incidence of the fusarium wilt disease. In 1991 and 1993 fusarium wilt was severe in the test area. Severity of the disease varies from year to year and also within the experimental area in the same year. Therefore, several years' data are necessary to realistically characterize a variety's wilt reaction.

Verticillium wilt is being identified more frequently in northern Alabama than previously reported. Varietal comparisons reported in Table 12 do not apply in any way to this disease.

STATISTICAL ANALYSIS

Appropriate analyses of the yield data were made. For each location, the variability in the test was measured and expressed as a percentage of the test mean, i.e., the coefficient of variation (C.V.). An indication of the magnitude of difference between variety averages necessary to be considered a real difference is given for each location. It is designated as the Least Significance Difference (L.S.D._{.05}).

LOCATIONS OF EXPERIMENTS

Tennessee Valley Substation, Belle Mina W.B. Webster, Superintendent
H.E. Burgess, B.E. Norris

Prattville Experiment Field D.P. Moore, Superintendent

E.V. Smith Research Center
Field Crops Research Unit, Shorter D. Williamson, Superintendent

Monroeville Experiment Field. J.R. Akridge, Superintendent

Wiregrass Substation, Headland. H.W. Ivey, Superintendent
L N. Wells, B.E. Gamble

Gulf Coast Substation, Fairhope E.L. Carden, Superintendent
N.R. McDaniel, M.D. Pegues

Appreciation is also expressed to Mien-Huei Tzeng, Research Data Analysis, for the computation, summarization, and analysis of the data in this report.

Table 20. Soil Types for Cotton Trials, 1994

Test Location	Soil type
Belle Mina	Decatur silt loam
E.V. Smith Research Center	
Field Crops Research Unit, Shorter	Norfolk sandy loam
Prattville	Lucedale fine sandy loam
Monroeville	Lucedale loam
Headland	Dothan sandy loam
Fairhope	Malbis fine sandy loam

Table 21. Sources of Seed for the 1994 Cotton Variety Tests

Deltapine Acala 90	Delta and Pine Land Co. Scott, Mississippi
Deltapine 50	
Deltapine 51	
Deltapine 20	
Deltapine DP 5415	
Deltapine DP 5690	
Deltapine DP 5409	
DES 119	
Stoneville 474	Stoneville Pedigreed Seed Co. Stoneville, Mississippi

Hartz H 1244	
Hartz H 1220	
Hartz H 1215	

Locations of Participating Research Units

★ Main Agricultural Experiment Station,
Auburn.

★ E. V. Smith Research Center, Shorter.

1. Tennessee Valley Substation, Belle Mina.
2. Prattville Experiment Field, Prattville.
3. Monroeville Experiment Field, Monroeville.
4. Wiregrass Substation, Headland.
5. Gulf Coast Substation, Fairhope.
