1999 Alabama Cotton Variety Report

A REPORT OF THE PERFORMANCE OF COTTON VARIETIES TESTED IN ALABAMA

K. M. Glass, C. D. Monks, and C. H. Burmester¹

INTRODUCTION

The Alabama Cotton Variety Test is a continuing evaluation of available cotton varieties from private companies and state agricultural experiment stations. Breeding lines that are likely to be released as varieties are also tested. Tests are conducted on units of the Alabama Agricultural Experiment Station by Experiment Station personnel. Cultural practices are those generally recommended by the Auburn University Extension System to producers. Data are reported on an irrigated test at Belle Mina, Shorter, and Headland. No other tests received scheduled supplemental irrigation. Every effort is made to test the varieties and present the results in an unbiased manner.

EXPERIMENTAL CONDITIONS

Tests were split into early season and full season varieties. Deltapine DP 5409, Deltapine Acala 90, Deltapine NuCotn 33B, and Suregrow 125 were included in both early and full season tests for comparison. The maturity category for each variety was chosen by the company or cooperator. Plot size was two rows at Prattville, Headland, Belle Mina, Shorter, and Fairhope, and one row at Monroeville. Row length varied at different locations from 20 to 120 feet. A randomized complete block experimental design with four replications was used in all tests.

EXPLANATION OF DATA

Harvest of Seed Cotton

A 50-boll sample was taken by hand for ginning; then test plots at all locations were harvested by a mechanical spindle picker. Average seed cotton yield was determined for each variety at each location.

Lint Percentage

Seed cotton samples from each variety were ginned on a 10-saw gin. Lint percentage was calculated by dividing weight of lint by seed cotton weight.

Yield of Lint

Lint yield was determined by multiplying the lint percentage by seed cotton yield.

Fiber Properties

Fiber qualities of all varieties were measured by the Auburn University Textile Engineering Fiber Physical Testing Laboratory using High Volume Instrumentation (HVI). Data are reported on a single composite sample of each variety from all locations including the regional tests at Shorter and Belle Mina.

Length

This is the fiber length measured with the HVI instrument. This measurement of length is similar to the classer's staple.

¹Glass is an Agricultural Program Associate, Monks is an Extension Cotton and Soybean Specialist, and Burmester is an Extension Agronomist in the Auburn University Department of Agronomy and Soils.

Strength

This is a measure of breaking strength of a standard fiber bundle with the holding jaws separated by 1/8 inch. "Tex" is a size measurement of the fiber bundle and the data given are the force in grams needed to break this bundle.

Elongation

A measure of the percentage stretch before the fibers break.

Micronaire

This measures the fineness of the cotton fibers. The smaller the micronaire reading, the finer and/or more immature the fibers.

Earliness

Earliness is reported as the percentage of the total yield harvested at the first picking where more than one harvest was made.

Fusarium Wilt

Reaction of varieties to *Fusarium oxysporum* f. *vasinfectum* (fusarium wilt) was evaluated at the Plant Breeding Unit, Talladega. Breeder lines and selected varieties were grown in a field with a high natural incidence of the fusarium wilt disease. In 1999, incidence of Fusarium wilt was light. The incidence ratings can be found in the 1999 National Fusarium Wilt Cotton Report, Departmental Series No. 221.

STATISTICAL ANALYSIS

Appropriate analyses of the yield data were made. For each location, the variability in the test was measured and expressed as a percentage of the test mean, i.e., the coefficient of variation (C.V.). An indication of the magnitude of difference between variety averages necessary to be considered a real difference is given for each location. It is designated as the Least Significance Difference (L.S.D._{.05}).

LOCATION OF EXPERIMENTS

Tennessee Valley Research and Extension Center	B.E. Norris, Supt. H.E. Burgess
Prattville Experiment Field	D.P. Moore, Supt.
E.V. Smith Research Center Field Crops Research Unit, Shorter	J.S. Bannon, Dir. B. Durbin, Supt.
Monroeville Experiment Field	J.R. Akridge, Supt.
Wiregrass Research and Extension Center, Headland	L.N. Wells, Supt. B.E. Gamble
Gulf Coast Research and Extension Center, Fairhope	N.R. McDaniel, Supt. M.D. Pegues

Appreciation is also expressed to Mien-Huei Tzeng, Applied Statistics Consulting Lab, Discrete and Statistical Sciences, for the computation, summarization, and analysis of the data in this report.

C.V.	10%					

*Early check varieties. **Full check varieties.

+Due to poor stands in some varieties, combined with a lack of moisture throughout the growing season, yields were reduced and may not reflect yield potential under normal conditions. Also, only three replications were used in reporting early season variety yields.
