# **2000 Alabama Cotton Variety Report**

## **A REPORT OF THE PERFORMANCE OF COTTON VARIETIES TESTED IN ALABAMA**

**K. M. Glass, C. D. Monks, and C. H. Burmester<sup>1</sup>**

### **INTRODUCTION**

The Alabama Cotton Variety Test is a continuing evaluation of available cotton varieties from private companies and state agricultural experiment stations. Breeding lines that are likely to be released as varieties are also tested. Tests are conducted on units of the Alabama Agricultural Experiment Station by Experiment Station personnel. Cultural practices are those generally recommended by the Alabama Cooperative Extension System to producers. Data are reported on an irrigated test at Belle Mina, Shorter, and Headland. No other tests received scheduled supplemental irrigation. Every effort is made to test the varieties and present the results in an unbiased manner.

### **EXPERIMENTAL CONDITIONS**

Tests were split into early season and full season varieties. The maturity category for each variety was chosen by the company or cooperator. Deltapine NuCotn 33B and Suregrow 747 were included in both early and full season tests for comparison. Plot size was two rows at Prattville, Headland, Belle Mina, Shorter, and Fairhope, and one row at Monroeville. Row length varied at different locations from 20 to 120 feet. A randomized complete block experimental design with four replications was used in all tests. Please note that both early and full season tests at Fairhope failed due to drought conditions at planting and during the early part of the growing season.

### **EXPLANATION OF DATA**

#### **Harvest of Seed Cotton**

A 50-boll sample was taken by hand for ginning; then test plots at all locations were harvested by a mechanical spindle picker. Average seed cotton yield was determined for each variety at each location.

#### **Lint Percentage**

Seed cotton samples from each variety were ginned on a 10-saw gin. Lint percentage was calculated by dividing weight of lint by seed cotton weight.

#### **Yield of Lint**

Lint yield was determined by multiplying the lint percentage by seed cotton yield.

#### **Fiber Properties**

Fiber qualities of all varieties were measured by the Auburn University Textile Engineering Fiber Physical Testing Laboratory using High Volume Instrumentation (HVI). Data are reported on a single composite sample of each variety from all locations including the regional tests at Shorter and Belle Mina.

#### **Length**

This is the fiber length measured with the HVI instrument. This measurement of length is similar to the classer's staple.

---

<sup>1</sup>Glass is an Agricultural Program Associate, Monks is an Extension Cotton and Soybean Specialist, and Burmester is an Extension Agronomist in the Auburn University Department of Agronomy and Soils.

**Strength**

This is a measure of breaking strength of a standard fiber bundle with the holding jaws separated by 1/8 inch. "Tex" is a size measurement of the fiber bundle and the data given are the force in grams needed to break this bundle.

**Elongation**

A measure of the percentage stretch before the fibers break.

**Micronaire**

This measures the fineness of the cotton fibers. The smaller the micronaire reading, the finer and/or more immature the fibers.

**Uniformity**

This is the ratio between the mean length and upper half mean length of the fibers and is expressed as a percentage. Cotton with a low uniformity may be difficult to process.

**Earliness**

Earliness is reported as the percentage of the total yield harvested at the first picking where more than one harvest was made.

**Fusarium Wilt**

Reaction of varieties to *Fusarium oxysporum* f. *vasinfectum* (fusarium wilt) was evaluated at the Plant Breeding Unit, Tallassee. Breeder lines and selected varieties were grown in a field with a high natural incidence of the fusarium wilt disease. In 2000, incidence of Fusarium wilt was moderate. The incidence ratings can be found in the 2000 National Fusarium Wilt Cotton Report, Departmental Series No. 231.

**STATISTICAL ANALYSIS**

Appropriate analyses of the yield data were made. For each location, the variability in the test was measured and expressed as a percentage of the test mean, i.e., the coefficient of variation (C.V.). An indication of the magnitude of difference between variety averages necessary to be considered a real difference is given for each location. It is designated as the Least Significance Difference (L.S.D.<sub>.05</sub>).

**ACKNOWLEDGMENTS**

Appreciation is expressed to the following supervisory personnel of the outlying units whose quality work makes this a reliable source of information for farmers in their areas. Chet Norris and Ellis Burgess, Tennessee Valley Research and Extension Center; Don Moore, Prattville Research Field; James Bannon and Bobby Durbin, E.V. Smith Research Center; Randy Akridge, Monroeville Research Field; Larry Wells and Brian Gamble, Wiregrass Research and Extension Center; Ronnie McDaniel and Malcomb Pegues, Gulf Coast Research and Extension Center.

Appreciation is also expressed to Mien-Huei Tzeng, Applied Statistics Consulting Lab, Discrete and Statistical Sciences, for the computation, summarization, and analysis of the data in this report.
