

Mississippi COTTON

VARIETY TRIALS, 2004

Experiment Station

Vance H. Watson, Director

Mississippi Agricultural & Forestry Experiment Station

J. Charles Lee, President • Mississippi State University • Vance H. Watson, Vice President

NOTICE TO USER

This Mississippi Agricultural and Forestry Experiment Station information bulletin is a summary of research conducted under project number 171460 at the Delta Research and Extension Center in Stoneville, Mississippi, and several other locations in the state. It is intended for the use of colleagues, cooperators, and sponsors. The interpretation of data presented herein may change after additional experimentation. Information included herein is not to be construed either as a recommendation for use or as an endorsement of a specific product by Mississippi State University or the Mississippi Agricultural and Forestry Experiment Station. Trade names of commercial products used in this report are included only for clarity and understanding. All available names (trade names, chemical names, experimental product code names or numbers, etc.) of products used in this research project are listed in the tables contained in this report.

2004 Mississippi Cotton Variety Trials

T.P. Wallace, Associate Professor

C. E. Snipes
MAFES, Delta Research & Exp. Stn.
Stoneville, MS

A special thanks to: W. E. Clark, Robert Sullivan and Dee Dobbs of the Delta Research and Extension Center for their technical assistance.

ACKNOWLEDGMENT

Most of the variety trial locations are on research stations throughout the state. Trials that are planted on commercial farms give an added dimension to the results. While on-farm trials present logistical obstacles to researchers and to producer-cooperators, data from these trials give an important indication of how varieties will perform in “real world” situations. The authors wish to express their appreciation to W.E. Clark, Robert Sullivan and Dee Dobbs of the Cotton Improvement Program at Delta Research and Extension Center for their technical assistance, and also to the Mississippi cotton producers who allow us to conduct these variety trials on their farms and often put up with the aggravation of farming around small-plot research:

Brad Cobb, Tunica
Cliff Heaton, Clarksdale
Clark Carter, Rolling Fork
John Henry Miller, Desoto County
Jeff Parkinson, Durant

Introduction

Variety selection is one of the first decisions a cotton producer makes each season, and perhaps the single most important. Results from this research are intended to be an aid in making this crucial decision. Certain data will also be of interest to ginners, millers, and other sectors of the cotton industry. The varieties reported here were submitted by the cottonseed companies.

All varieties, regardless of transgenes present, were evaluated in these tests under standard management practices, including chemical control of insects with conventional insecticides. The potential advantage of transgenes is not the subject of these tests and was not evaluated.

In all tests, seed of each variety was supplied by the company that submitted the variety for testing. Recommended management practices were followed in each test. The on-farm cooperators decided planting dates, fertilizer rates, amount of supplemental irrigation, defoliation date, insect and weed control strategies, and harvest date. These tests do not encompass all growing and environmental conditions in the state, but they provide a guide to producers in selecting among varieties best suited for their growing conditions.

Varieties submitted for testing were divided into two groups based on maturity as determined by the company submitting each variety. The Early-Maturity Cotton Variety Test was comprised of 37 varieties in the Delta and 30 in the Hill area of Mississippi. The Mid-maturity Cotton Variety Test was comprised of 26 varieties in the Delta and 24 varieties in the Hills. PhytoGen PSC 355 and Stoneville 474 were included as “check” varieties in all trials.

The Early-Maturity and Mid-season Variety Tests were conducted at five locations in the Delta: Stoneville, Tunica, Clarksdale, Rolling Fork, and Tribbett. Due to excessive rains, the trial located at Tunica was not harvested for yield. Boll samples, however, were collected at the Tunica location for determination of fiber quality.

Early-Maturity and Mid-season Tests were conducted at seven Hill locations: Mississippi State, Brooksville, Durant, Holly Springs, Desoto County, Raymond, and Verona.

All tests were planted solid in 38- or 40-inch rows. Experimental design for each trial consisted of a randomized complete block with 4-6 replications. Yield determinations were based on the weight of seed cotton mechanically harvested from two-row plots that ranged from 40 to 45 feet in length. Determination of lint percentage, boll size, seed index (weight in grams of 100 fuzzy seed), and fiber properties were made from hand-picked 50-boll samples or from machine-harvested grab samples from 3-4 replications at each location. Samples were ginned on a 10-inch saw laboratory gin. HVI fiber property determinations were made by Starlab, Inc., Knoxville, TN.

At the bottom of each table are summary statistics that are very important in interpreting the test results. Despite efforts to provide a uniform test environment, all experiments are subject to a certain degree of error due to variation between plots arising from differences in soil type, fertility, insect damage, weed pressure, etc. Therefore, yield potential (and performance with respect to other characteristics) cannot be measured with complete accuracy. By conducting replicated trials we can account for or remove some, but not all, of the effect of non-uniform conditions among plots. As a result, the mean performance of some varieties may be numerically different due to natural variation in the data, but not statistically different when variability in the test is taken into account. The least significant difference (LSD) estimates the smallest difference between two varieties that should be considered something other than natural variation. For example, if the LSD for lint yield in a given trial is 80 lb/A, varieties that differ by less than 80 lb/A should be considered equal in yield. In key tables and for key traits, values that are not significantly different from the variety with the highest value in the trial are shown with shaded background.

The coefficient of variation (CV) is a measure of relative precision of a given trial and is generally considered to be an estimate of the amount of unexplained variation in that trial. In general, the higher the CV, the less precise a given trial. The R-squared value is another measure of relative precision. The higher the R-squared value, the more precise a trial.

Results and Conclusions

In any single year or location, a given variety may perform extremely well or extremely poorly due either to chance variation or due to its response to environmental conditions in that particular site and year. In order to avoid being misled by performance in a single year and location, it is wise to base variety selection decisions on as many environments as possible. While it is hoped that newer varieties will perform better than older varieties, this is not always the case. Greater confidence can be put in varieties that have performed well over two or more years than can be put in varieties that are in their first year of testing. Producers should consider these new varieties/technologies as not being thoroughly evaluated until multiple year, multiple locations results are available.

Anyone may obtain online 2004 weather data from several weather stations across Mississippi from: <http://www.deltaweather.msstate.edu/>

[†]A color and leaf grad of 41-4 was assumed for all calculations

[‡]Estimates based upon a seed value of \$80 per ton

Loan Price was determined by entering OVT fiber data into the **Cotton Loan 2004 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on **USDA** premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.

[†]A color and leaf grad of 41-4 was assumed for all calculations

[‡]Estimates based upon a seed value of \$80 per ton

[†]Loan Price was determined by entering OVT fiber data into the **Cotton Loan 2004 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on USDA premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.

Table 14. Averages[†] for lint yield and fiber quality traits over locations in the Delta Region Mid Maturity Test in the 2004 Mississippi State University Cotton Variety Trials.

[†]A color and leaf grad of 41-4 was assumed for all calculations

[‡]Estimates based upon a seed value of \$80 per ton

[†]Loan Price was determined by entering OVT fiber data into the **Cotton Loan 2004 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on **USDA** premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.

Table 24. Averages[†] for lint yield and fiber quality traits over locations in the Hill Region Early Maturity Test in the 2004 Mississippi State University Cotton Variety Trials.

[†]A color and leaf grad of 41-4 was assumed for all calculations

[‡]Estimates based upon a seed value of \$80 per ton

Loan Price was determined by entering OVT fiber data into the **Cotton Loan 2004 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on **USDA** premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.
