ACKNOWLEDGMENTS

Appreciation is expressed to the cooperators that provided their land, equipment and time in assisting with prepping, planting, managing and harvesting of these plots throughout the year. All cooperators are listed in Table 1.

Appreciation is extended to the **Texas Department of Agriculture** for funding that supports the fiber grading/analysis performed at the Fiber and Biopolymer Research Institute in Lubbock. Without this support, these trials would not be possible. Also, appreciation is extended to all of the local cooperators who take time to plant, manage and harvest all of these trials with their own equipment. Finally, we would like to extend our appreciation to **Cotton Incorporated** through the **Texas State Support Committee** for their partial funding of these trials.

2012 HIGHLIGHTS

Variety selection is the most important decision made during the year. Unlike herbicide or insecticide decisions that can be changed during the season to address specific conditions and pests, variety selection is made only once, and variety selection dictates the management of a field for the entire season. Variety decisions should be based on genetics first and transgenic technology second. Attention should be focused on agronomic characteristics such as yield, maturity, and fiber quality when selecting varieties. Figure 1 outlines the Best Management Practices for variety selection.

Texas producers planted 6.6 million acres of cotton in 2012 which was about 0.5 million less than 2011. In the east/south Texas regions (Lower Rio Grande Valley, Southern and Northern Blacklands, South Texas/Wintergarden and Upper Coastal Bend), 1.11 million acres were planted in 2012.

Transgenic varieties accounted for 99% of the state acreage in 2012 which is up from 86% in 2011. According to the USDA-Agricultural Marketing Service “Cotton Varieties Planted 2012 Crop” survey, the estimated percentage of upland cotton planted to specific Brands in Texas are as follows, Alltex had 8.6%, Americot/NexGen had 18.6%, Bayer CropScience – FiberMax had 40%, Bayer CropScience – Stoneville had 2.3%, Croplan Genetics had 0.3%, Delta Pine had 19%, Dyna-Grow had 2.4%, FiberMax had 45%, Phytogen had 8.4% and other at 0.4%.

To assist Texas cotton producers in remaining competitive in the Lower Rio Grande Valley, Blacklands, South Texas/Wintergarden and Upper Coastal Bend regions, the Texas A&M AgriLife Extension Service-Cotton Agronomy program has been

conducting, large plot, on-farm, replicated variety trials for the past eight years (Figure 2). This approach provides a good foundation of information that can be utilized to assist the variety selection process.

Twenty-two Replicated Agronomic Cotton Evaluation (RACE) Trials were planted in 2012 and are listed in Table 1. The 2012 season began with good rainfall prior to cotton planting, but beginning mid-March, the rainfall events were poorly timed. In general, it remained relatively dry through late May when some areas began to receive some isolated rainfall events. Isolated rain showers occurred periodically through early July. Some isolated locations received suffered some fruit loss due to extended, cloudy-wet conditions in early July which had a negative effect on yields and delaying crop maturity. Despite the challenges of 2012, some great yields were obtained in the Upper Coastal Bend, Winter Garden, and other isolated areas that received some timely rains. The exception to this general 2012 season summary is the Coastal Bend of Texas, very little precipitation fell and the majority of the cotton was not harvested.

Mean location yields ranged from 2658 lbs/ac for the Weslaco irrigated location to 596 lbs/ac for the Williamson Co dryland location. The highest yielding dryland location was Colorado Co, with a mean yield of 1844 lbs/ac.

All the cotton seed companies with RoundupFlex® or Glytol® and Bt2® or Widestrike® technology had the opportunity to include at least one variety in the RACE trial at each location. All varieties were treated with either Aeris or Avicta Complete Pak seed treatment. Included in this publication are the cotton variety descriptions provided by company. See descriptions on page 8-10.

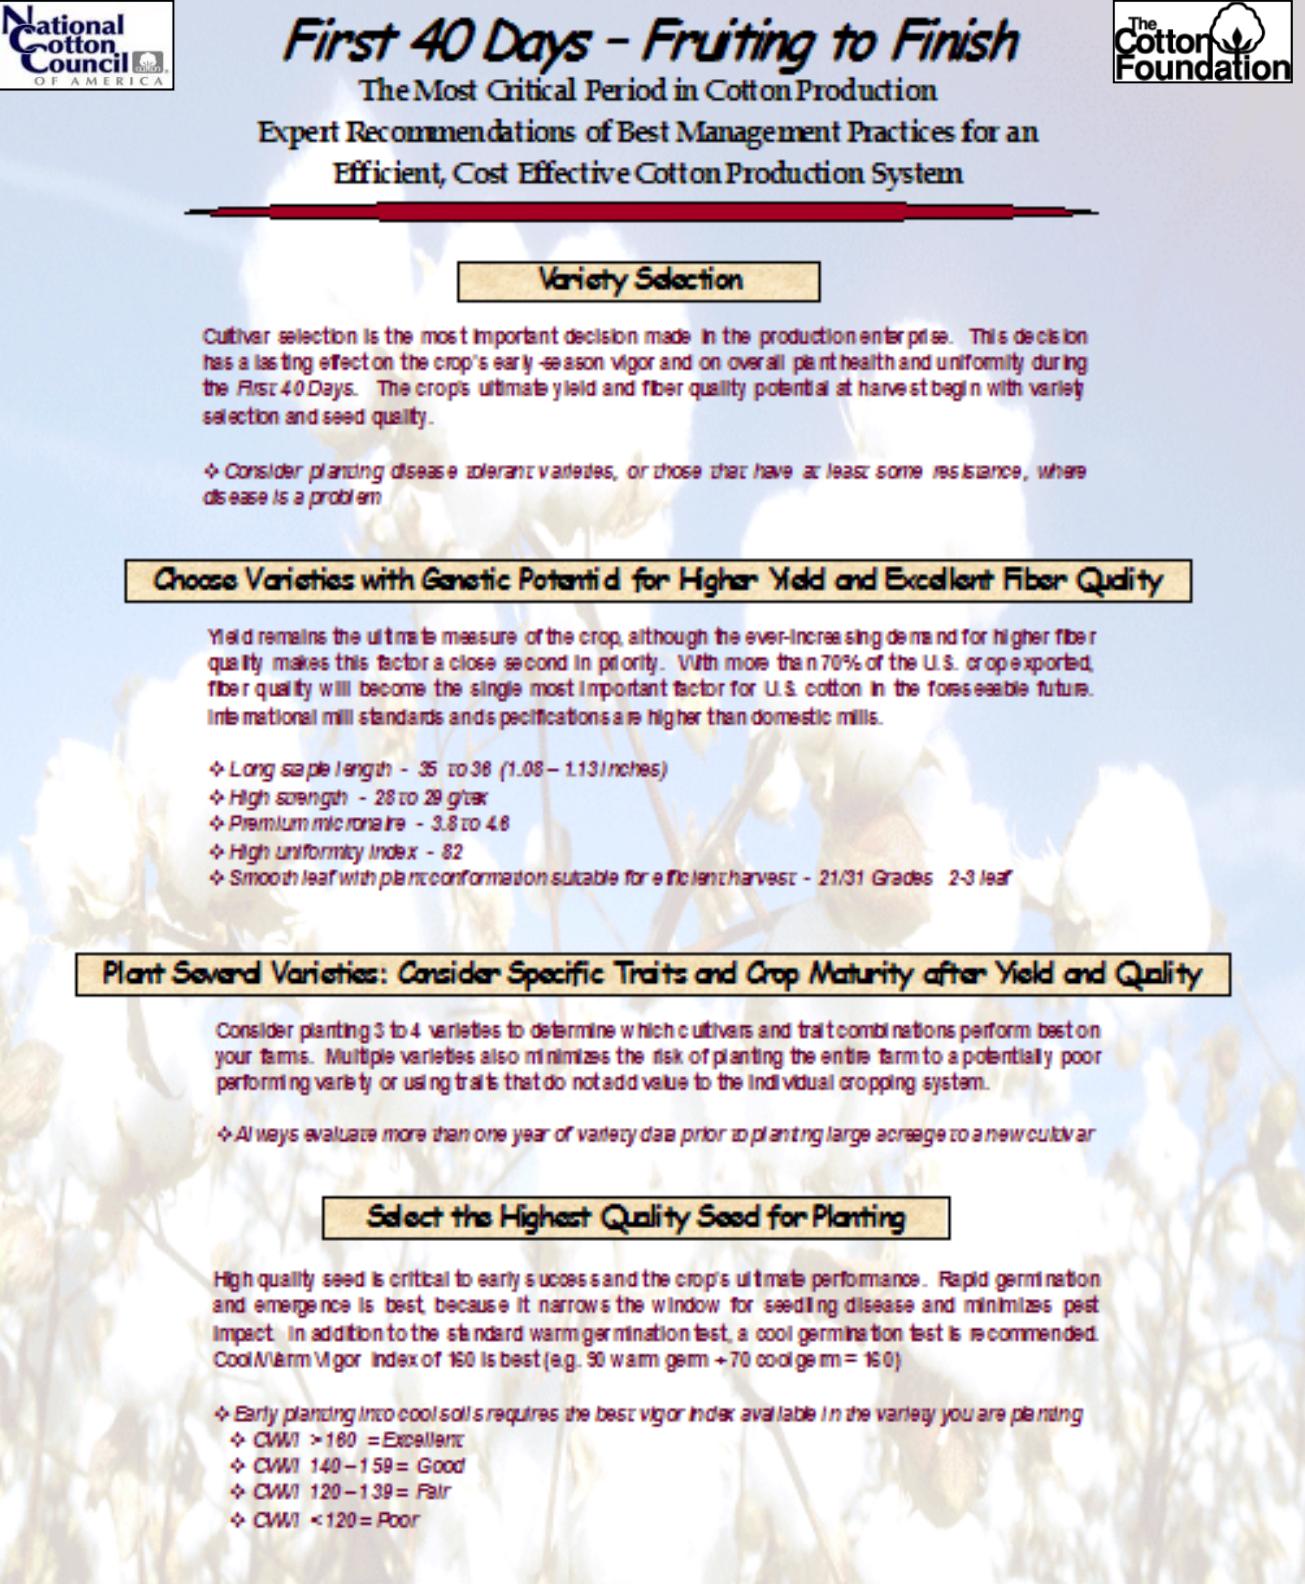

In addition to the RACE trials, a Liberty Link (LL), and two Monster cotton variety trials were conducted in 2012 and the final yields and grades from these are included in this publication. Table 1 provides a list of planting and harvest dates, row spacing and plot area for each location. Tables 2-5 shows numerical rankings based upon lint yield for the varieties across all locations. Only varieties that were planted at a minimum of three locations for the Lower Rio Grande Valley (Table 2) and Coastal Bend Counties (Table 3), seven locations for the Upper Coastal Bend (Table 4), and three locations for the Central Blacklands County locations (Table 5) were included in these four tables. Tables 6 to 27 include the cotton variety yield data and fiber analysis for each individual location. Data featured in these tables include, statistical analysis of yield, turnout, fiber quality parameters, loan and gross lint value/acre. Most locations were ginned with a 10-saw table-top gin with no lint cleaner. This method consistently produces higher lint turnout percentages than would be common in a commercial gin. Consequently, higher

turnouts equate to lint yields which are generally higher than area-wide commercial yields. Additionally, all data were standardized to a color grade and leaf of 41-4.

The statistical analysis quantifies the variability of the test site conditions, such as soil type, harvesting, insect damage, etc. A CV (coefficient of variation) of 15% or less is generally considered acceptable and means the data are dependable. A trial with a small LSD (least significant difference), indicates more consistency within the trial and higher likelihood of identifying differences among varieties. A trial location with a large LSD and large CV indicates a higher degree of variability at the trial location. Non-significance is represented as “NS” and indicates no differences among the varieties within the data column at a 5% significance level.

Varieties that are statistically different from one another will not have the same letter next to the corresponding number value in a column. For example, Table 6 (Uniform Stacked-Gene Cotton Variety Trial in Cameron county) lint yields for DP 1252 B2RF (1404 lbs of lint/acre) and PHY 499 WRF (1305 lbs of lint/acre) are both followed by a like letter, “a”, and thus are considered significantly similar for yield. However, DP 1252 B2RF (1404 lbs of lint/acre) and CG 3787 B2RF (1230 lbs of lint/acre) do not have a like letter following each of them and are therefore considered significantly different from one another.

The Cotton Foundation

First 40 Days - Fruiting to Finish

The Most Critical Period in Cotton Production

Expert Recommendations of Best Management Practices for an Efficient, Cost Effective Cotton Production System

Variety Selection

Cultivar selection is the most important decision made in the production enterprise. This decision has a lasting effect on the crop's early season vigor and on overall plant health and uniformity during the First 40 Days. The crop's ultimate yield and fiber quality potential at harvest begin with variety selection and seed quality.

- ◆ Consider planting disease tolerant varieties, or those that have at least some resistance, where disease is a problem

Choose Varieties with Genetic Potential for Higher Yield and Excellent Fiber Quality

Yield remains the ultimate measure of the crop, although the ever-increasing demand for higher fiber quality makes this factor a close second in priority. With more than 70% of the U.S. crop exported, fiber quality will become the single most important factor for U.S. cotton in the foreseeable future. International mill standards and specifications are higher than domestic mills.

- ◆ Long staple length - 35 to 38 (1.08 – 1.13 inches)
- ◆ High strength - 28 to 29 g/tex
- ◆ Premium micronaire - 3.8 to 4.6
- ◆ High uniformity index - 82
- ◆ Smooth leaf with plant conformation suitable for efficient harvest - 21/31 Grades 2-3 leaf

Plant Several Varieties: Consider Specific Traits and Crop Maturity after Yield and Quality

Consider planting 3 to 4 varieties to determine which cultivars and trait combinations perform best on your farms. Multiple varieties also minimize the risk of planting the entire farm to a potentially poor performing variety or using traits that do not add value to the individual cropping system.

- ◆ Always evaluate more than one year of variety data prior to planting large acreage to a new cultivar

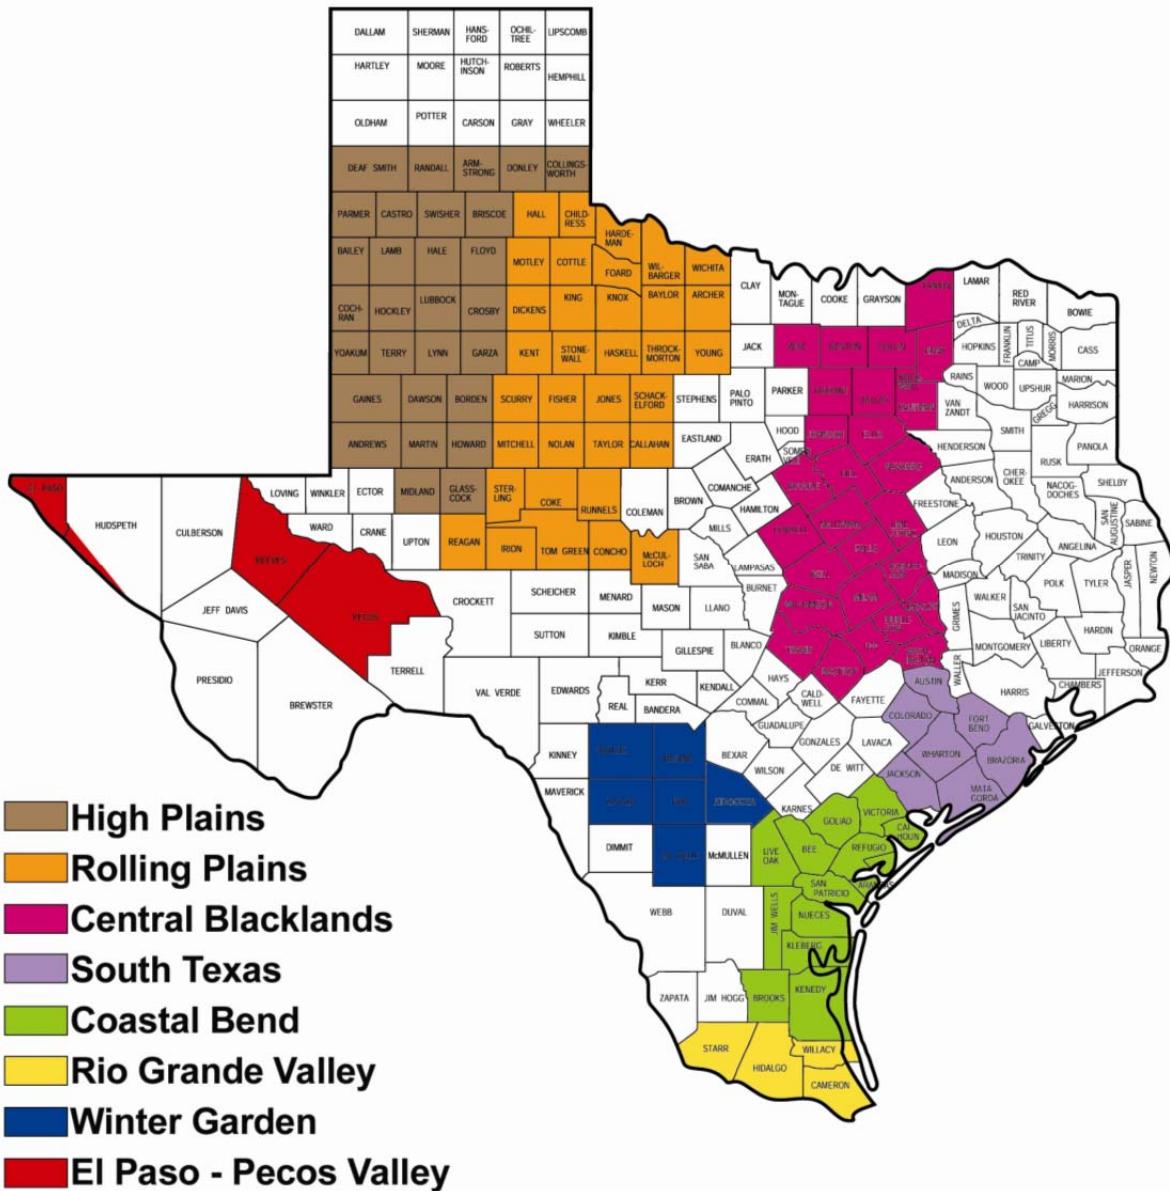

Select the Highest Quality Seed for Planting

High quality seed is critical to early success and the crop's ultimate performance. Rapid germination and emergence is best, because it narrows the window for seedling disease and minimizes pest impact. In addition to the standard warm germination test, a cool germination test is recommended. Cool/Warm Vigor Index of 160 is best (e.g. 90 warm germ + 70 cool germ = 160).

- ◆ Early planting into cool soils requires the best vigor index available in the variety you are planting
- ◆ CWVI > 160 = Excellent
- ◆ CWVI 140 – 159 = Good
- ◆ CWVI 120 – 139 = Fair
- ◆ CWVI < 120 = Poor

Figure 2

COTTON PRODUCTION REGIONS - TEXAS

Variety Characteristics/Highlights

Below are the cotton variety characteristics and highlights that were included in the 2012 Uniform Variety Trials and other common varieties planted in these regions.
These cotton variety descriptions were provided by individual seed company representatives or publicly available information.

CROPLAN GENETICS 3787 B2F

- Mid-full maturity
- Adapted for dryland but produces good under irrigated conditions
- Excellent seedling vigor
- Very good storm tolerance
- Excellent fiber package

DeltaPine 0935 B2RF

- Mid maturity variety
- Smooth leaf
- High gin turnout
- Nectariless trait for plant bug suppression
- Good overall fiber quality

DeltaPine 0949 B2RF

- Medium-tall plant height
- Mid-full maturity variety
- Light-hairy leaf
- High gin turnout

DeltaPine 1044 B2RF

- Mid-full maturity
- Semi-smooth leaf
- Excellent fit on dryland and limited irrigation
- V good Verticillium and Bacterial Blight resistance

DeltaPine 1048 B2RF

- Medium-tall plant height
- Mid-full maturity
- Semi-smooth leaf
- Offers improved staple and uniformity
- Good Bacterial Blight and moderate Verticillium resistance

DeltaPine 1219 B2RF

- Medium-tall plant height
- Early maturity variety
- Semi-smooth leaf
- Broadly adapted across Texas
- Good combination of yield and fiber quality

DeltaPine 1252 B2RF

- Medium-tall plant height
- Smooth leaf
- Great fit for irrigated and more productive full season environments

FiberMax 1740 B2RF

- Early/medium maturity variety
- Medium-tall plant with a slightly bushy growth habit
- Benefits from early season PRG applications
- Features good fiber properties
- Well-adapted to all cotton growing areas

FiberMax 1944 GLB2

- GlyTol® + LibertyLink® and Bollgard II® technology
- Early-medium maturity....more towards medium maturity
- Widely adapted across entire Cotton Belt – irrigated or dryland
- Well suited for limited irrigation

FiberMax 2989 GLB2

- Medium maturity variety
- Smooth leaf
- Medium-tall plant with a slightly bushy growth habit
- Benefits from early season PRG applications
- Features good fiber properties
- Well-adapted to all cotton growing areas

FiberMax 8270 GLB2

- GlyTol® + LibertyLink® and Bollgard II® technology
- Medium to full maturity
- Okra leaf variety
- Especially well suited for Coastal Bend dryland production

NexGen 1511B2RF

- Medium maturity
 - Semi-smooth leaf
- Excellent seedling vigor

Phylogen 367 WRF

- Indeterminate,
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor
- Root Knot Nematode resistance

Phylogen 375 WRF

- Indeterminate,
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor
- Has atypical high degree of yield stability and quality for an early maturing cotton

Phylogen 499 WRF

- Mid-maturity variety with exceptional yield potential and very high turnout
- Aggressive growth, greater than PHY 375 WRF
- Consistent across soils and environments, suited for dryland and irrigated fields
- Outstanding seedling vigor and early season growth
- Larger seed size ~ 4,000 – 4,200 seed/lb.

Stoneville 5288 B2RF

- Medium maturity variety
- Features excellent seedling vigor and sets a exhibits a high level of fruiting nodes
- Well suited for irrigated and dryland conditions
- Low PGR needs
- Features good fiber properties
- Benefits from an early, aggressive harvest aid management strategy
- Well adapted to the Southwest

Stoneville 5458 B2RF

- Medium maturity
- Exceptional yield potential
- Root-knot nematode tolerance
- Good fiber quality
- Excellent seedling vigor
- High lint percent

Table 1. Trial, cooperator, planting date, harvest date, row spacing, plot dimensions and area of 2012 Texas A&M AgriLife Extension RACE Trials harvested.

County	Cooperator	Planting Date	Harvest Date	Row Spacing (inches)	Plot Dimensions	Irrigated or Dryland	Area harvested/plot
